

Security

We value you and your confidentiality. Rest assured, all customer applications are being done on our secure server. All data is transmitted using state-of-the-art encryption using SSL (secure socket layers). This is the same encryption technology used by all e-commerce sites to transmit confidential credit card numbers.

For all of our customers, private information is never sent over the internet unprotected. When you are on the application page, notice in the address line that the URL is **https**. This is a universal symbol for secure. If you have your images turned on, you should see a closed padlock using Internet Explorer or an unbroken key using Netscape. Using America On-Line, the symbol is also a closed padlock. These are the universal signs of secure server application.
